

FeasiBuild

One Engine. Eleven Asset Types. Two Financial Realities.

Most feasibility tools force every asset into the same spreadsheet. FeasiBuild doesn't. Two distinct financial engines – built for the way each asset class actually performs.

FEASIBUILD

PROPTech

PROJECT FINANCE

Why Two Streams? Because the Math Is Fundamentally Different

Sale Stream

Profit at exit. Value is realized on completion and sale. The model optimizes for speed, absorption, and residual land value.

Operational Stream

Value over years. Income is earned over the hold period. The model optimizes for stabilized yield, debt service, and long-term NOI.

Conflating the two is how a hotel gets modeled like a condo – and a loan application dies in committee.

SALE STREAM

5 Building Types Built to Sell

Every sale-side asset shares one goal: maximize residual value and exit IRR. FeasiBuild models each with the right absorption curves, pricing ladders, and escrow milestones.

Landed Residential

Terrace, Semi-D, and Bungalow – strata or non-strata, phased or single-title.

High-Rise Residential

Condo, Apartment, and Serviced Residence – launch pricing, absorption, and strata mix.

Landed Shop-Offices

Ground-floor retail with office above – strata-title commercial with retail yield benchmarks.

Strata Office

Multi-tenant commercial towers sold floor-by-floor or strata-title by suite.

Strata Warehouse

Industrial units sold on strata title – logistics positioning and buyer segmentation.

6 Asset Classes Built to Hold

Every hold-side asset earns over time. FeasiBuild models stabilized NOI, debt service coverage, and operational KPIs native to each sector.

Hotel / Hospitality

RevPAR, ADR, occupancy curves, and management agreement structures.

Shopping Mall & Retail

WALT, base rent vs. turnover rent, anchor tenant mix, and footfall projections.

Office

Grade A/B/C positioning, lease-up ramps, and incentive period modeling.

Residential BTR

Build-to-rent yields, unit mix optimization, and long-term lease structures.

Warehouse / Industrial

Clear height, loading ratios, and logistics demand modeling.

Data Centre

PUE, power density, colocation vs. hyperscale, and long-term offtake agreements.

Two Languages. One Platform.

FeasiBuild doesn't translate between streams – it speaks both natively. Each engine uses the metrics lenders, equity partners, and regulators actually require.

Sale Stream Metrics

- | | |
|--|--|
| → Development IRR – unlevered and levered returns to equity | → Residual Land Value – maximum bid price at target return |
| → Peak Equity – maximum capital draw before recycling | → Escrow Milestones – construction-linked payment schedules |

Operational Stream Metrics

- | | |
|--|--|
| → Stabilized Yield – NOI at stabilized occupancy on cost | → NOI & DSCR – net operating income and debt service coverage |
| → WALT – weighted average lease term for income certainty | → RevPAR / PUE – sector-specific operational KPIs |

40+ Segment & Positioning Combos — Jurisdiction-Native

FeasiBuild doesn't just model asset types – it models the **segment, product tier, and jurisdiction** that define real-world feasibility. Over 40 combinations, calibrated to local market conventions.

Dubai / UAE

DLD escrow structures, off-plan payment plans, strata law, and DIFC financing conventions.

Malaysia

HDA compliance, strata title timelines, and developer interest-bearing accounts.

Australia

Stamp duty land tax, planning gain, and viability assessments

FeasiBuild

Same Platform. Completely Different Math.

Most tools force every asset into one spreadsheet. That's how you get a hotel modeled like a condo – and a loan application that dies in committee.

FeasiBuild runs two separate financial engines across 11 asset types and 40+ segment combinations – so your feasibility study speaks the language your lender actually understands.
